

CTNT 2026 - Elliptic Curve Cryptography

Suggested Exercises

- P1.** Find the least non-negative residue class of $6^{182} \bmod 13$.
- P2.** Find the least non-negative residue class of $6^{-58} \bmod 13$.
- P3.** Show that 6 is a primitive root modulo 13.
- P4.** Find x such that $6^x \equiv 5 \bmod 13$.
- P5.** Alice and Bob want to communicate using a Diffie–Hellman key exchange first, using $p = 13$ and $g = 6$.
- Alice picks $a = 2$. Compute $A \equiv g^a \bmod p$.
 - Alice receives $B = 2$ from Bob. Compute the secret key produced by the Diffie–Hellman key exchange that Alice and Bob will share.
 - Your name is Eve and you are *very nosy*. You intercept some messages from Alice and Bob who are setting up a Diffie–Hellman key exchange. You now know that $p = 13$, $g = 6$, and intercept $A = 3$ from Alice, and $B = 5$ from Bob. Use this information to generate the secret key that Alice and Bob are planning to share. (Note: it is not the same key that they were sharing in part (b) of this problem).
- P6.** The following is a table of some powers modulo 17:

$x \bmod 17$	x^2	x^3	x^4	x^5	x^6	x^7	x^8	x^9	x^{10}	x^{11}	x^{12}	x^{13}	x^{14}	x^{15}	x^{16}
4	16	13	1	4	16	13	1	4	16	13	1	4	16	13	1
6	2	12	4	7	8	14	16	11	15	5	13	10	9	3	1
9	13	15	16	8	4	2	1	9	13	15	16	8	4	2	1
10	15	14	4	6	9	5	16	7	2	3	13	11	8	12	1
13	16	4	1	13	16	4	1	13	16	4	1	13	16	4	1
15	4	9	16	2	13	8	1	15	4	9	16	2	13	8	1

- (15 points) Princess Leia is expecting communications from the rebel alliance, and sets up an Elgamal public cryptography system, with $p = 17$ and $g = 10$. She chooses $a = 5$ and publishes p , g , and $A \equiv g^a \bmod p$.
 - Compute A .
 - Luke wants to send the message $m = 3$ to Leia. Explain what steps Luke has to do to send the message, and produce an encrypted version (c_1, c_2) of the message.
 - Leia receives an encrypted message $(15, 9)$ from Chewbacca. Use the Elgamal method to decipher Chewbacca's message.
- (5 points) Governor Tarkin intercepts a rebel transmission $(13, 2)$, which has been encoded with an Elgamal cryptosystem (different from the one above). He knows that $p = 17$, $g = 6$, and $A = 9$. Decipher the transmission.

P7. Use Shank's baby-step giant-step algorithm to find x such that

$$5^x \equiv 3 \pmod{23}.$$

- (a) The order of 5 mod 23 is 22, so compute $n = 1 + \lfloor \sqrt{22} \rfloor$.
- (b) Compute List 1: $1, g, g^2, \dots, g^n \pmod{23}$.
- (c) Compute $u \equiv g^{-n} \pmod{23}$.
- (d) Compute List 2: $h, h \cdot u, h \cdot u^2, \dots, h \cdot u^n \pmod{23}$.
- (e) Use the information above to finish the baby-step giant-step algorithm and find x such that $5^x \equiv 3 \pmod{23}$.

P8. The number $p = 179424673$ is prime and 15 is a primitive root mod p . Find x such that $15^x \equiv 2 \pmod{p}$.
